Turkish - B1

Experience

○ Jun 2022 -Aug 2022

Eszterházy Károly Research Team

Frontend Developer Intern

Our five person team developed a Mind map web-application using TypeScript and React where my part was to implement changing background color, font-size and the border of a node as well as dragging it on the display (changing x/y position).

Projects

Background Generator

This app helps to generate gradient color based on 2 colors. You can either choose your own colors or click on generate button that will randomly generate a gradient color for you. You can choose the direction of the gradient flow and copy CSS code to your clipboard.

Books Inventory

A University project where we developed a full-stack application with PHP, JavaScript and MySQL. This project can maintain register, sign in, session management and image upload. A user can perform CRUD operations on the books that have been added by him/her.

TowerOfHanoi

A University project for Artificial Intelligence class that solves the problem of Tower of Hanoi using State-space representation model. I also made visual representation in Windows Forms to show how the process of solving the problem goes.
